Not to be confused with 9 Metis.

Metis (/ˈmiːtɪs/; Greek: Μήτις), also known as **Jupiter XVI**, is the **innermost moon of Jupiter**. It was discovered in 1979 in images taken by *Voyager 1*, and was named in 1983 after the first wife of Zeus, **Metis**. Additional observations made between early 1998 and September 2003 by the *Galileo spacecraft* allowed its surface to be imaged.

Metis is [tidally locked](#) to [Jupiter](#), and its shape is strongly asymmetrical, with one of the diameters being almost twice as large as the smallest one. It is also one of the two moons known to orbit Jupiter in less than the length of Jupiter's day, the other being [Adrastea](#). It orbits within the [main ring of Jupiter](#), and is thought to be a major contributor of material to the [rings](#).

Discovery and observations [\[edit \]](#)

Metis was discovered in 1979 by [Stephen P. Synnott](#) in images taken by the *Voyager 1* probe and was provisionally designated as **S/1979 J 3**.^{[5][6]} In 1983 it was officially named after the mythological [Metis](#), a [Titaness](#) who was the first wife of [Zeus](#) (the [Greek equivalent](#) of [Jupiter](#)).^[7] The photographs taken by *Voyager 1* showed Metis only as a dot, and hence knowledge about Metis was very limited until the arrival of the *Galileo* spacecraft. *Galileo* imaged almost all of the surface of Metis and put constraints on its composition by 1998.^[3]

Although the [Juno](#) orbiter, which arrived at Jupiter in 2016, has a camera called [JunoCam](#), it is almost entirely focused on observations of Jupiter itself. However, if all goes well it should be able to capture some limited images of the innermost moons [Metis](#) and [Adrastea](#).^[8]

Physical characteristics [\[edit \]](#)

Metis has an irregular shape and measures 60×40×34 km across, which makes it the second smallest of the four [inner satellites of Jupiter](#).^[3] Therefore, a very rough estimate of its surface area could be placed between 5,800 and 11,600 square kilometers (approx. 8,700). The bulk composition and mass of Metis are not known, but assuming that its mean density is like that of [Amalthea](#) (~0.86 g/cm³),^[9] its mass can be estimated as ~3.6×10¹⁵ kg. This density would imply that it
